

1-ON-1 COACHING BLUEPRINT · BUILT FROM OUR CALL

Zamiyah: Elite Performance & Shape Program

A 5-day recomposition build: glute & hip-dip shelf development, arm definition, a flat and functional core, athletic conditioning, and a splits progression. Built around everything you walked me through on the phone.

GOAL	TIMELINE	STRUCTURE	LEVEL

FROM OUR CALL

Why I built it this way

You walked me through all of it on the phone: the lifts you already love, the hip dips, the arm insecurity, wanting a split by your birthday. Nothing below is generic. I built the periodization, the arm and core strategy, and the athletic layer around exactly what you told me, so it adds up to the shape you're after by February 26 instead of staying four good days that don't compound.

On the hip dips: that "shelf" comes from the upper glute medius/minimus, a different target than the glute max work your hip thrusts and squats already hit. I kept your abduction and clamshell work and added a forward-lean cable angle and a slow pulse variation. Both bias the upper fibers specifically.

On the "bat wings": no amount of tricep volume spot-reduces arm fat, that comes down from your nutrition and total training volume. What the arm work here does is build shape underneath so that as the fat comes off, there's definition waiting, not just skin. That's why Day 3 stays higher-rep and lighter-load: shape, not size.

On "not big, just bigger glutes": heavy compound lower-body work paired with a controlled diet builds the glutes preferentially while the rest of you leans out. That's recomposition, and it's exactly what you told me on the call you want.

On the athletic piece: plyometric and agility work is loaded in small, high-quality doses on Days 1, 2, and 4. Enough to build real jump and change-of-direction capacity without adding junk volume on top of your lifting.

Programmed to the ISSA CPT standard, for Echelon Fitness Collective.

28-WEEK ARC

Roadmap to February 26

Four phases, each ending in a deload week. Same five-day split throughout; what changes is load, volume, and how tight your nutrition gets.

WEEKS 1-7

Phase 1: Foundation & Reconnection

Rebuild the habit first. Technique on every lift, light plyo to teach landing mechanics before intensity, and the tracking habit starts here, not later.

Baseline photos, measurements, and a split-depth check happen in Week

1. Deload Week 7.

WEEKS 8-15

Phase 2: Shape & Strength Build

Progressive overload on hip thrust, sumo squat, and RDL. Hip-dip shelf work and Day 3 arm volume both step up. Plyo/agility complexity increases. Deload Week 15.

WEEKS 16-23

Phase 3: Recomposition Push

Nutrition tightens to a modest deficit here (see Nutrition). Metabolic finishers added to Day 2 and Day 4, ab definition work stays consistent. This is the phase that reveals the shape Phase 2 built. Deload Week 23.

WEEKS 24-28

Phase 4: Peak & Polish

Volume tapers ~15% so you walk into your birthday recovered, not depleted. Splits progression gets its final push, conditioning stays sharp. Week 28: photo check-in against Week 1 baseline.

WEEKLY STRUCTURE

The five-day split

DAY	FOCUS	WHY IT'S PLACED HERE
Day 1	Glute Power + Hip-Dip Shelf (Heavy)	Fresh CNS for your heaviest compound pull of the week.
Day 2	Athletic Core, Agility & Conditioning	Recovery day for the lower body, load day for jump/agility work and abs.
Day 3	Back, Posture & Arm Definition	Full upper-body recovery from Day 1, posture work for the hourglass line.
Day 4	Glutes, Hamstrings & Side-Glute Volume	Second glute stimulus of the week, volume-biased instead of heavy.
Day 5	Mobility, Splits & Light Home Recovery	Active recovery before Day 1 restarts the week; where your splits get made.

Glute Power + Hip-Dip Shelf

WARM-UP

Glute Bridges	2 × 15
Banded Lateral Walks	2 × 15 steps/side
Clamshells (bodyweight)	2 × 15/side
Pogo Hops (new, primes landing mechanics)	2 × 20

MAIN LIFTS

EXERCISE	SETS × REPS	LOAD
Hip Thrust	4 × 6–8	45 lb
Cable Kickback	3 × 8–10/leg	25 lb
Romanian Deadlift	3 × 8–10	25 lb
Step-Ups (lean-forward, glute bias)	3 × 10/leg	15 lb

Hip thrust: ribs down, chin tucked, drive through heels, not a lower-back movement.

RDL: hips travel back, not down; soft knee bend; feel the stretch in the hamstring before you reverse.

Step-up: torso leans forward over the front leg so the glute, not the quad, does the driving.

HIP-DIP SHELF FINISHER (SUPERSET)

5A · Standing Cable Abduction, torso leaned forward	3 × 15–20/leg	40 lb
5B · Cable Clamshells	3 × 12–15/side	10 lb
5C · Side-Lying Hip Abduction Pulses (new)	2 × 20/side	bodyweight

The lean-forward angle and the slow pulse both bias the upper glute medius fibers, the muscle that fills in the hip dip. This block is non-negotiable even on days you're short on time.

ATHLETIC FINISHER (2×/WEEK)

Lateral Bounds	3 × 6/side
Broad Jump to Stick	3 × 5

DAY 2 / TUESDAY

Moderate · ~45 min

Athletic Core, Agility & Conditioning

AGILITY & PLYO BLOCK

Agility Ladder (in-ins & lateral shuffle)	4 × 20 sec
Jump Squats	3 × 8
Lateral Skater Bounds	3 × 8/side

No ladder at home? Tape an X-pattern on the floor and use that instead. The point is quick feet and clean landings, not the equipment.

CORE CIRCUIT (2-3 ROUNDS)

Hanging Knee Raises	3 × 10-15
Sit-Ups	3 × 12-15
Dumbbell Marches	3 × 30-45 sec
Plank	3 × 30-60 sec
Bicycle Crunches	3 × 20-30 total

COOLDOWN

Cossack Squats: 10/side

Butterfly Stretch: 1 min

Side Lunge Hold: 45 sec/side

DAY 3 / WEDNESDAY

Toning · higher rep, shorter rest

Back, Posture & Arm Definition

WARM-UP

Arm Swings: 2 × 8

Cat-Cow: 2 × 8

Wall Angels: 2 × 8

BACK & POSTURE

EXERCISE	SETS × REPS	LOAD
Assisted Pull-Ups	2 × 8–10	more assistance
Lat Pulldown	3 × 10–12	45–50 lb
Seated Cable Row	2 × 10–12	40 lb
Face Pulls	3 × 8–10	40 lb

Pull-ups: stop 2–3 reps before failure; this is a maintenance block for your back, not a max-effort day.

ARM DEFINITION (60 SEC REST, LIGHT–MODERATE LOAD)

EXERCISE	SETS × REPS	LOAD
Triceps Pushdown	3 × 12–15	20 lb
Skull Crushers	2 × 12–15	light
Overhead Rope Tricep Extension (new)	2 × 15–20	light

Three angles (pushdown, overhead, and skull crusher) cover the whole triceps without heavy loading. This builds shape, not size; the fat loss that reveals it happens through nutrition (see below), not through more sets.

OPTIONAL FINISHER

Incline Push-Ups: 2 × 12–15

Glutes, Hamstrings & Side-Glute Volume

WARM-UP

Banded Lateral Walks: 2 × 15 steps/side

Glute Bridges: 2 × 15

MAIN LIFTS

EXERCISE	SETS × REPS	LOAD
Sumo Squat (Heavy)	4 × 6–8	45 lb
Single-Leg RDL	3 × 8–10/leg	25 lb
Hyperextensions (glute bias)	3 × 12–15	25 lb
Seated Leg Press (glute stance, feet high & wide)	3 × 10–12	45 lb
Lying Hamstring Curl	3 × 10–13	40 lb

SIDE-GLUTE FINISHER (SUPERSET)

6A · Side-Lying Leg Raises	2 × 12–15/side
6B · Curtsy Lunges	2 × 10–12/side

CORE FINISHER

Dead Bugs	45 sec
Plank	45 sec
Bicycle Crunches	45 sec
Hollow Hold or Knee Tucks	45 sec

DAY 5 / AT HOME

Light · full flow ~25–30 min

Mobility, Splits & Light Recovery

Your flow, held in sequence, two rounds through. Hold times below are your floor; add 5–10 seconds per position every two weeks as range opens up.

01 Cossack Squats

10 each side, dynamic, keep it moving

02 Butterfly Stretch

1 min: contract 5 sec, relax, sink deeper, repeat 3×

03 Side Lunge Hold

45 sec each side

04 Frog Stretch

1–2 min

05 Pancake Stretch

1 min: track fingertip-to-floor distance monthly

06 Middle Split Lean

30–45 sec

07 Wall-Assisted Middle Split

1 min: lower the support height as range improves

OPTIONAL LIGHT CARDIO

15–20 min incline walk, or light jump rope, low-impact enough to arrive fresh for Monday.

FUEL

Nutrition Protocol

Recomposition happens on the plate more than on the platform. At 154 lb, here's the target, built around what you told me on the call you want: more protein, tighter carbs, more water.

PROTEIN

150g/day

FAT

55g/day

CARBS

175–225g/day

WATER

90–100oz/day

- **Phases 1 & 2 (Weeks 1–15):** hold near 2,000 kcal with the macros above; carbs toward the higher end (~225g), concentrated around Days 1 and 4 when you're lifting heaviest.
- **Phase 3 (Weeks 16–23):** step down to roughly 1,750–1,800 kcal by trimming carbs toward ~175g. Protein and fat stay put; this is where the deficit does its work without costing you strength.
- **Phase 4 (Weeks 24–28):** back up to ~1,900 kcal so you're recovered and full, not depleted, going into your birthday.
- Protein at every meal: chicken, fish, eggs, Greek yogurt, cottage cheese, lean beef. This is the one number that matters most for keeping the muscle you're building while the fat comes off.
- Water climbs on Day 1 and Day 4; add 16–24 oz on top of baseline on heavy lift days.
- Sleep is currently averaging 6 hours, that's the quiet limiter on both glute recovery and appetite control. Even pushing toward 7 hours will show up faster than any dietary change.

General fitness and nutrition guidance from your coach, not a substitute for individualized clinical dietary advice. Check with a physician before starting the plyometric or splits work if you have any joint, hip, or back history.

FLEXIBILITY

Splits Take Frequency, Not Just a Day

One session a week won't get you a split by February; range of motion responds to frequency. Keep Day 5 as your full flow, and add two short 10-minute "flexibility snacks" on off-evenings (pancake fold + middle split lean is enough) to triple your weekly stretching frequency without adding a real session.

- Check fingertip-to-floor distance on the pancake stretch monthly, that's your clearest progress marker.

- Photograph the wall-assisted middle split monthly from the same angle; lower the support height as depth improves.
- Never stretch into sharp or pinching pain; a deep stretch sensation is the target, pain is the stop signal.

ACCOUNTABILITY

What We Track

You told me on our call that inconsistent tracking has been the barrier, so the system here is deliberately light. Five things, logged weekly, nothing more.

WHAT	FREQUENCY	WHY
Sessions completed	Weekly	Target 5/5, floor is 4/5; this is the number that predicts the outcome more than any other.
Body weight	1 ×/week, same morning conditions	Trend over 4 weeks, not day to day.
Protein grams	Daily, even if estimated	The one macro worth tracking precisely.
Progress photos	Every 2 weeks	Recomposition shows in the mirror before it shows on the scale.
Waist / hip / thigh measurements	Monthly	Confirms the shift the scale alone won't.

Everything above is built on what you told me on our call already works for you. I've just given it a runway to February 26. Message me through the Member Portal with how Week 1 feels; we'll adjust from there.
